WEEK-5

Analyse and implement N Queens problem using Simulated Annealing technique.

ALGORITHM:

```
FUNCTION GenerateInitialState(n):
  Return a list of n random integers between 0 and n-1

FUNCTION CalculateCost(state):
  n = length of state
  cost = 0
for i from 0 to n-1:
  for j from i+1 to n-1:
    if state[i] == state[j] or abs(state[i]-state[j]) ==
                                    abs(i-j):
        increment cost by 1
  return cost

FUNCTION GenerateNeighbour(state):
  n = length of state
  new_state = copy of state
  row_to_stage = random integer between 0 and n-1
  new_state[row_to_change] = random integer
      between 0 and n-1
  return new_state

FUNCTION SimulatedAnnealing(n, initial_temperature,
                                cooling_rate):
  current_state = GenerateInitialState(n)
  current_cost = CalculateCost(current_state)
  temperature = intial_temperature
```

```
IF neighbour_cost < current_cost:
    current_state = neighbour_state
    current_cost = neighbour_cost
ELSE:
    delta_cost = neighbour_cost - current_cost
    probability = Exp(- delta_cost / temperature)
IF random number between 0 and 1 < probability:
    current_state = neighbour_state
    current_cost = neighbour_cost
temperature = temperature * cooling_rate
return current_state, current_cost

n = 8
initial_temperature = 100
cooling_rate = 0.95

solution, cost = SimulatedAnnealing(n, initial_temperature,
                                    cooling_rate)
if cost == 0:
    PRINT "solution found:"
    PRINT solution
ELSE:
    PRINT "could not find a perfect solution."
    PRINT "Best solution found:"
    PRINT solution
    PRINT "cost:", cost
```

CODE-

```
import random
import math

def generate_initial_state(n):
  """Generates a random initial state for the N-Queens problem."""
  return [random.randint(0, n - 1) for _ in range(n)]
